The invention describes a molecule (I) inhibiting uptake by the high CC affinity low density lipoprotein (LDL) receptor of LDL or its partially CC modified form. (I) And an antibody (II) that binds (I) are useful in the CC manufacture of a medicament for inhibiting uptake by the high affinity CC LDL receptor of LDL or a partially modified form of it. (I) And (II) are CC useful in the diagnostic test for oxidised LDL, or antibody specific CC against oxidised LDL, which will cause uptake by the high affinity LDL CC or (II) with a sample; (b) detecting an antibody-antigen binding reaction CC; and (C) correlating the detection of the antibody-antigen binding reaction CC oxidised LDL, which will cause uptake by the high affinity LDL receptor CC of LDL or a partially modified form of the antibody-antigen binding CC reaction with the presence of oxidised LDL, or antibody specific against CC oxidised LDL, which will cause uptake by the high affinity LDL receptor CC of LDL or a partially modified form of it. (I) Is useful as an immunogen, CC e.g., for the production of antibodies, and particularly in the treatment CC and diagnosis of atherosclerosis. (I) And (II) are useful as reagents in CC diagnostic tests, and for preventing foam cell formation. This is the conhibit uptake of the high affinity low density lipoprotein (LDL) by the

                                                                                                                                                                                                                                                              CC The invention relates to a molecule comprising one of three fully defined comparising one of three partially modified form. The molecule is useful for treatment or diagnosis of the comparising uptake by the high affinity LDLR or its partially comparising uptake by the high affinity LDLR or its partially modified comparist oxidised LDL or oxidised LDL respectively, which will compare uptake by the high affinity LDLR or its partially modified comparising the high affinity LDLR or its partially modified comparising and antibodies are for diagnosting and treating the form.

CC antherosclerosis. The present sequence represents a human apolipoprotein B
                                                                                                                                                                                                                             Query Match

This sequence is an example of the peptide of the invention. It has the CC formula (I), or their variants with one or more internal deletions, CC insertions or substitutions, while retaining anti-coagulant properties of CC apolipoprotein B-100 (apoB-100), Z1-KAQ-X1-KXKHRHS-X2-T-Z2 (I) X1 = S or Y, X2 = T or I; Z1 = the N terminus of the peptide, or 1-47 amino acids CC (aa), Z2 = the C terminus of the peptide, a terminal amide group or 1-77 cc an compositions containing the paptide, a terminal amide group or 1-77 cc metastatic spread. They are also used to inhibit thromboplastin-mediated CC during or after surgery or in cases of heart attack, stroke etc.) and to prevent argiogenesis, celular differentiation or apoptosis. KRAD-14, CC activation of the prothrombinase complex, and prevents activation of the surface of thromboplastin and of platelets by thrombin. CC smaller than apoB-100, they act more onlickly.

The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KAEYKKNKHRH (1) or TRELTEXERGEK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (1) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (11) additives for cell culture media especially as growth supplements. Non-naturally occurring, receptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding affiliate to approach the complete apone for a particle sequence.
                                                                                                                                                                      Synthetic

This sequence is an example of the peptide of the invention. It has the formula (I), or their variants with one or more internal deletions, insertions or substitutions, while retaining anti-coagulant properties of apolipoprotein B-100 (apoB-100). Z1-KAQ-X1-KKNKHRHS-X2-T-Z2 (I) X1 = S of Y. X2 = T or I, Z1 = the N terminus of the peptide, or 1-47 amino acids (aa); Z2 = the C terminus of the peptide, a terminal amide group or 1-77 aa. Compositions containing the peptide are used for simultaneous, separate or sequential treatment of cancer, particularly to prevent
                                                                                                                                                                                                                                                                                                              Peptide fragments of apo:lipo:protein B-100 with anticoagulant activity used for treating or preventing coagulation, inhibiting angiogenesis, cell differentiation and apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present low density lipoprotein (LDL) binding peptide can be used an absorbent to remove LDL from body fluids, or as a LDL binding reage The peptide can be prepared easily and at low cost, and has excellent stability and preservability. It specifically binds LDL, and does not cause bradykinin production, white blood cell activation or blood

                         AAW57208;
                            AAW57208 standard; peptide;
                                                                                                                            The invention relates to a novel ligand for binding a target biomolecule, which comprises a peptide having at least one sulphated or sulphonated charged amino acids. The movel ligands can be used from reutral and positively than sequence represents a heparin binding peptide relating to the treatment of invantion and positively invantion.
                                                                                                                                                                                                   Use of a ligand comprising of at least one sulfated or sulfonated amino retinopathy and hypoxia.
                                                                                                                                                                                                                                                              WPI; 2003-300420/29.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a nonnaturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KABYKKNKKHRH (1) or TRETREREGIK (2), or their the containing and the containing analogue and the containing and the 
     Apo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (1) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring, receptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding

The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 10% identity with sequences: KARYKNIGH(I) or TRLIFRKRGLK(2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring, receptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding affirity for an apo B protein receptor.
                                                                  Sequence
                                                                                                   affinity to
                                                                                                                                                                                                                                                                                                                                                                       Claim 13; Fig
                                                                                                                                                                                                                                                                                                                                                                                                                   Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells

Human PDGFR-beta related navigation peptide SEQ ID NO:25

29-AUG-2003

(first entry)

pDGFR-beta; platelet derived growth factor receptor beta; nanoparticle; delivery; encapsulated molecule; cycostatic; antimicrobial; gene therap; sustained delivery; cell proliferation disorder; infectious disease; genetic defect; aberrant gene regulation. therapy;

Homo sapiens

```
The present invention describes nanoparticles (I) capable of delivery of CC an encapsulated molecule into a living cell, comprising an encapsulation CC acid homologue sequence (II) encapsulated with EM, where the CC time. (I) have cytostatic and antinicrobial activities, and can be used completed extended period of comparticles are capable of releasing (II) over an extended period of comparticles are capable of releasing (II) over an extended period of complete cacid homologue within a subject, by encapsulating a nucleic acid composition of a subject by sustained delivery and release of a cc homology within (I), and introducing (II) into the subject. (I) can also be of nucleic acid homologue, by encapsulating an isolated nucleic acid condition within EM, so that nanoparticles are formed, and delivering the sequence designed to alleviate symptoms of the medical condition within EM, so that nanoparticles are formed, and delivering the sequence is released over an extended period of time. A pharmaceutical composition comprising (I) can be used for treating a medical condition defect and abservant gene regulation. The nanoparticles are capable of introducing the nucleic acid into the cell very efficiently. The present contains a platelet derived growth factor receptor beta (PDGFR present invention)
                                                                               Matches

   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             B B

                                                                FUNCTION: Apolipoprotein B is a major protein constituent of chylomicrons (apo B-48), LDL (apo B-100) and VLDL (apo B-100). Ap B-100 functions as a recognition signal for the cellular binding and internalization of LDL particles by the apoB/E receptor. SUBCELLULAR LOCATION: Secreted.
